

Our wish is to supply you with safer rice.

We produce naturally cultivated Koshihikari rice on the Saga Plain, one of the best rice-producing areas in Japan, utilizing only sunlight, water and soil. Improper use of not just chemical fertilizers, but even organic fertilizers can harm crops. We believe that we should use only existing nature when producing rice for the Japanese people for whom it is a staple. For the past 30 years, we have supplied safe and delicious rice, produced under our strict standards and quality management methods.

The 4 principles of the Kitamura method

Never add chemical fertilizers, organic animal fertilizers, or plant-derived organic fertilizers to the soil.

Never use seed disinfectants, the hot water disinfection method, insecticides or germicides on the seeds.

Never use insecticides, germicides, or chemical or organic fertilizers when growing seedlings.

Never use herbicides, insecticides, or chemical or organic fertilizers in the rice field.
